

Portfolio performance — observations

Read this with the Power BI report. Nothing is selected on the slicers unless a finding says otherwise.

1. The return miss is one line, and it is not operations.

Forecast return is 6.4% against a 13.7% budget. Net income year-to-date is about \$73.7 million against a budget of about \$217.3 million. NOI is about \$11.7 million ahead of its year-to-date budget. Other Gain / Loss was budgeted at about \$192.6 million and came in at about \$35.2 million. That gap is larger than the whole net-income miss.

Page 1 — return cards, gauge, and the income statement.

2. The highest return is not an operating asset.

Asset F shows the highest forecast return, about 15.3%, and almost no NOI. That return is mark-to-market. Asset C, about 4.1%, is the weak operating asset. Right-click a bar on the return-by-asset chart and choose Drill through to open that asset's full income statement. Asset B is Canada, Retail, with NOI year-to-date of about \$22.1 million.

Page 1 return bar, then page 2.

3. The book grew because capital was spent, not because assets were revalued.

Equity moved from \$13.00 billion on 1 January 2019 to about \$15.54 billion on 31 December 2019. The increase is capex and leasing (about +\$1.69 billion) and acquisitions (about +\$1.35 billion), after dispositions (about -\$1.01 billion). Mark-to-market is a small bar on the same waterfall.

Page 3, Scenario set to Dec 2019.

4. North America is most of the book.

About \$11.50 billion of the roughly \$15.54 billion closing equity is North America. Europe is about \$2.56 billion. Asia Pac is about \$1.47 billion. Selecting North America on the page 3 region slicer drops the waterfall opening from \$13 billion to \$10 billion.

Page 3 — Region slicer. Country and Sector are not on this page. The bridge is stored by region, so a country filter would not split North America.
